

## Title: The Bribie Island Sportfishing Club Mangrove Jack, Barramundi & Milkfish project

### Q1: What do you intend to monitor?

Mangrove Jack - *Lutjanus argentimaculatus*

Barramundi - *Lates calcarifer*

Milk fish - *Chanos chanos*

Other species identified by Fisheries Queensland or third-party researchers

### Q2: Where will you monitor?

Where they are naturally occurring, but with a primary focus on South East Queensland.

Other areas identified by Fisheries Queensland or third-party researchers.

### Q3: Why is this species and area a priority for monitoring?

Mangrove Jack are of interest to the Bribie Island Sportfishing Club as there is interest in the influence of bankside residential development on species numbers, movement and distribution. They are also a popular sportfish, particularly with the younger generations and there is benefit for those participating in the project and recapturing the species in gaining more knowledge and awareness in the species.

Barramundi are of interest to the Bribie Island Sportfishing Club, particularly those caught in the passage and SEQ. There is also interest in understanding the movement and growth of the species and trying to better understand the change in numbers. Particularly to see if there is a pattern between flooding of northern barramundi impoundments and accidental escapees from fishing parks and farm dams and the presence of fish in the passage and wider afield in the south east corner.

For milkfish there very little understood in the movement and growth patterns of this iconic sportfish in Australia. This monitoring will hopefully shed some light on the species, particularly growth rates of larger individuals, given most of the research is on earlier growth rates as it relates to aquaculture and not older wild fish.

### Q4: Who will use your data?

1. Bribie Island Sport Fishing Club
2. ANSA QLD
3. Wider community
4. Approved Third Party Researchers

# Recreational Fishery Monitoring Plan

\*\* All data remains the property of Bribie Island Sportfishing Club Inc. and cannot be reprinted, published, analysed or used in whole or part without the express written permission of the above mentioned club with an exception granting ANSA QLD authority to analyse, display and promote the data and results, but not distribute to other third parties without prior consent and that this authority can be withdrawn at any time by written notice.

\*\* Data will only be shared with any party (including ANSA Qld, ANSA National, Qld Fisheries, etc.) subject to the approval of a majority vote of the members of Bribie Island SFC Inc. financial members. Each request for access is granted for a single instance and a separate request is required for each instance and may be subject to conditions as given by the Management Committee of RPGSC Inc. with an exception granting ANSA QLD authority to analyse, display and promote the data and results, but not distribute to other third parties without prior consent and that this authority can be withdrawn at any time by written notice.

## Q5: How will the data be used?

Data will be quality checked, collated and archived to be available for ANSA members and third parties upon request.

On a regular basis Bribie Island Sportfishing Club will use the activity and data to promote sustainable fishing and best practice fishing methods for these fish.

## Q6: What data quality do you require?

The primary objective of this project is to allow anglers opportunity to collect fishery data as a means of citizen science participation. The idea is to value add to the fishing experience and in doing so, create greater awareness of the study species (population, growth & movement patterns)

Although the primary focus of the program is citizen science based, data collection methods will be as robust as possible to ensure data quality is as high as possible to allow for as many potential end uses as possible. Data Quality will be set at a level where the complexity of collection and data entry methods does not greatly inhibit participation.

The quality of data is likely to be of indicative quality (better than demonstrative but not analytical)

## Q7: What is the proposed period of monitoring? When and how often will you monitor?

The intent is to commence monitoring in the South east Qld region throughout the year commencing on the 1st of December 2018 as this will give good quality data collection over a long period of time. Monitoring from then will be ongoing with no end date set at this time

Bribie Island Sport fishing Club will review the effort and results of the monitoring program on an annual basis with a view to learning and improvement, and assessment of whether resources could be better allocated to another priority.

Monitoring will primarily be opportunistic in nature (when members are fishing) noting that the club fishes at least once a month as part of routine club activities. Club activities usually occur on the weekend.

Members will be encouraged to participate in monitoring outside of scheduled club activities. Members fish a great deal more often than the average recreational angler, and usually with greater

# Recreational Fishery Monitoring Plan

effectiveness. One could anticipate monitoring to occur fortnightly or even more frequently in the study area.

## Q8: What methods will you use?

It is envisaged that the majority of fish will be captured with as little stress as possible, before careful measurement, tagging, and quick release.

- As part of normal recreational fishing activities, fish capture information as outlined in field of form: <http://www.ansaqld.com.au/awards/entry-form/> will be collected for Mangrove Jack, Barramundi, Milkfish and other species identified by Fisheries Queensland or third-party researchers.
- Members will fish according to the ANSA QLD code of Ethics (<http://www.ansaqld.com.au/code-of-ethics/>) and the National Code of Practice ([http://www.ansaqld.com.au/wp-content/uploads/2014/06/recfish\\_australia\\_ncop\\_brochure.pdf](http://www.ansaqld.com.au/wp-content/uploads/2014/06/recfish_australia_ncop_brochure.pdf)) adopted by ANSA QLD.
- Fish destined for release will be released according to the ANSA Code of Practice for Releasing Fish (<http://www.ansaqld.com.au/code-of-practice-for-releasing-fish/>)
- Tagging will be conducted according to the AUSTAG Manual (<http://www.ansaqld.com.au/wp-content/uploads/2016/07/Austag-Manual-Complete-with-Work-Instructions.pdf>) noting that the manual will be updated during 2016-17. Tagging data is added directly by members who tag a part of the fish capture form. Any field sheets used reflect fields in this web-form.
- Location of fish will be recorded using Queensland Government Logbook Maps (<https://www.business.qld.gov.au/industry/fisheries/commercial-fishing/monitoring-and-reporting/reporting-commercial-fishers/queensland-logbook-maps>)
- Fishes of Australia (<http://fishesofaustralia.net.au/>) is used to identify fish species

Pending advice and request from third party researchers (e.g. DAF and/or JCU) members may also be trained in the retrieval of otoliths. If required members will retain the large specimens to enable determination of both age and sex (identified as a key information gap).

## Q9: Who will be involved and how?

Monitoring will be conducted by Bribie Island Sport Fishing Club members and other ANSA QLD members who visit the area of interest. Reporting of recaptures will be open to the general public.

ANSA QLD will provide fish capture database facility, tags and support to Bribie Island Sport Fishing Club members

Fisheries Queensland or third-party researchers will be involved as interested or required to achieve the other objectives of the monitoring program.

## Q10: How will the data be managed and reported?

- Data is added directly by members into the fish capture form.
- When submitted this is logged in the ANSA QLD MySQL database.
- Results will be reported online using a series of codes that query the database and then visualise this data. Data will also be provided to Fisheries Queensland and third-party researchers to report

# Recreational Fishery Monitoring Plan

---

- Records are maintained on ANSA QLD server using MySQL database. Database is regularly backed up.

## Background

### Why do we need a plan like this?

ANSA Qld and our members have limited resources (money and time) to contribute to monitoring, so we need to make sure we are doing it for good reasons.

The plan is simply to help you think about why and where you want to direct your efforts. We should make sure that we are contributing to highest priority issues, not just tagging as many fish as we can. For this reason the ANSA Qld executive committee will seek input from Fisheries Queensland and other research institutions into highest priority species and locations to help refine monitoring effort.

It also demonstrates to others that we are professional in our approach to monitoring.

### How is the revised ANSA Qld tagging program different to what we have previously done under Suntag?

Tagging will be conducted according to the AUSTAG Manual (<http://www.ansaqld.com.au/wp-content/uploads/2016/07/Austag-Manual-Complete-with-Work-Instructions.pdf>) noting that the manual will be updated during 2016-17. Specific revisions include:

- ANSA QLD Tagging is now the name of our state program for Queensland
- Tagging data is added directly by members who tag as part of the fish capture form. Any field sheets used reflect fields in this web-form.
- Tags use the web address [www.ansaqld.org.au](http://www.ansaqld.org.au) instead of a phone number for submission of recaptured fish information.
- Tag and recapture information is generated online at [www.ansaqld.org.au](http://www.ansaqld.org.au) and replaces letters and certificates. Recapture certificates will be emailed to anglers in the future when an automated facility for this function is developed
- Records are maintained on ANSA QLD server using MySQL database. Database is regularly backed up.
- Recreational Fishery Monitoring Plans are required for all ANSA QLD Research and Tagging projects. These documents provide detail on target species and other project related matters
- Tag purchase is currently through Floytag. ANSA QLD reserves the right to select any supplier based on access, price and customer service.
- Tag Register and Audit will be maintained on ANSA QLD server using MySQL database. Database is regularly backed up.
- Location of fish will be recorded using Queensland Government Logbook Maps (<https://www.business.qld.gov.au/industry/fisheries/commercial-fishing/monitoring-and-reporting/reporting-commercial-fishers/queensland-logbook-maps>)
- Fishes of Australia (<http://fishesofaustralia.net.au/>) is used to identify fish species
